

## **Abstract of the Article**

### **"Business Models of Production and Logistic Chains under Shaping of Cooperation Relations"**

**by O. Bakhurets**

The topicality of the article is conditioned by the necessity of studying the problem of effective management of production and logistic chains, defining the point of main methodological approaches of production and logistic chains optimization under shaping intersystem cooperation relations, opportunities of creating business models of production and logistic chains by combination and modification of cooperative relations among members of these chains. Under such conditions the necessity of further development of known theoretical statements including complex solution of urgent, but scantily explored problems in production and logistic chains management becomes obvious.

The aim of carrying out the research is further development theoretical basis for management of complex production and logistic chains under formation of K-connections on the basis of business-modeling.

There is also defined the main methodological approaches of production and logistic chains optimization under formation of K-connections.

The issue of formation of business models of production and logistic chains under the formation of K-connections at different levels of complexity is explored in the research paper.
