

Abstract of the Article
**«Development of Methods of Economic Monitoring
of the Logistic System»**
by A. Abukhamedekh and D. Besarab

The level of logistic customer service is the main advantage in competitive activity of the modern market enterprises. Taking into account that changes in enterprises working modes and in environment take place quickly enough, it is possible to talk about the necessity in further development of the systems of such phenomena monitoring.

The analysis of literary sources allows to say that the issue of development of methods of economic monitoring of the logistic systems hasn't been studied thoroughly enough. There is a small number of works, which purposefully consider the questions of economic monitoring. They mainly focus on financial matters.

Literary sources today do not provide precise classifications of methods of economic monitoring. However, taking into account that economic monitoring overlaps with controlling, diagnostics etc we should use the experience of these subjects.

Summarizing the review of the existing methods, it is possible to draw a conclusion, that there are no materials considering the methods and models of monitoring the objects of research. Most of the works basically deal with analysis.

Relying on the determination of control methods, and also the concept of monitoring, it is possible to give the determination of the method of economic monitoring – it is the sum total of ways and methods which help to achieve the goals of monitoring.

It is suggested to distinguish (to classify) monitoring methods into such groups: supervision, evaluation, forecasting. When systematizing this information and also taking into account the elements of logistic service, the approach to forming the groups of methods of economic monitoring of the logistic system is offered.

As the methods of supervision in the systems of economic monitoring it is suggested to take the methods of collection of information as a basis, that is used in marketing.
