

Abstract of the Article
«Indices Structuring of Enterprise Development Efficiency System»
By V. S. Ponomarenko, I. V. Gontareva

Different groups of indices were analyzed in this article. They describe the general operating and development efficiency of an enterprise and the necessity to introduce the category of system efficiency in an enterprise. Existing approaches to the defining of the system efficiency category were reviewed and the disadvantages were revealed.

A two-level multi hierarchical structure of indices system efficiency was designed and described. The structure of enterprise development efficiency system includes one index on the top level that characterizes all general features of the system efficiency, five complex indices that characterize effectiveness, potential quality, economy, efficiency, functional organization and 16 partial indices.

The second level includes target standards and social and economic indicators. This structure is invariant and concerns a great number of problem situations that occur in the process of decision making and allow the process formalizing.
