**«Organization of Controlling the Business Risks**  
**and Benefits of the Development of Risk-technologies»**  
**by M.V. Nikolaychuk**

Dynamic environment of the enterprise operation and internal business process requires management to make decisions primarily in conditions of uncertainty, which in modern market generally promotes risk.

An objective need of improving the efficiency of risk management systems of modern economic space requires the need in subsystems organization of their controlling at the enterprises and also requires identifying areas of further improvement of risk-management through a complex interaction with the process of controlling the last one, complementarities of the process for more effective management now.

The purpose of research is the development of methodical recommendations on the functional organization of controlling risks at the enterprise and to determine the benefits of the introduction and implementation of the proposed methods.

The most effective in the system of controlling risks in the company is a synthesis that allows decentralizing the process of initial identification of risks and centralizing the assessment and risk management.

The introduction and implementation of systems and technologies of risk management by controlling at modern enterprises will contribute to gaining significant information, process and cost of benefits.

An optimization of risk-management systems at Ukrainian enterprises is proposed to exercise through improved institutional, methodological and subjective psychological component of the management.
